

Video Time-Inserter TIM-10

End-of-life March 2017

Our Video Time-Inserter TIM-10 is still used today in many scientific applications.

However, analogue video cameras will be replaced more and more by digital cameras today and they can not be used with our time-inserter. Due to this the sales figures of the TIM-10 has decreased to a point where the production is not economical anymore. The production of the TIM-10 has stopped at March 2017.

At the moment we do not see any solution to insert a time stamp with a comparable accuracy at a reasonable effort to a digital standard camera so no new product is planned for the future.

If you still have an application requiring a precise time-inserter to an analogue video camera, one of our resellers has stocked a few inserters, so please contact Supra Praha (<http://www.supra-dalekohledy.cz>) to check its stock.

We still have technical support and spare parts for our time-inserters for the next years.

If you have a scientific application requiring an analogue video time-inserter, don't hesitate to ask us for a small batch reproduction.

Yours truly
Alexander Meier
